RAID 1 (mirroring)

😀 can recover from single-disk failure

😭 requires 2N disks

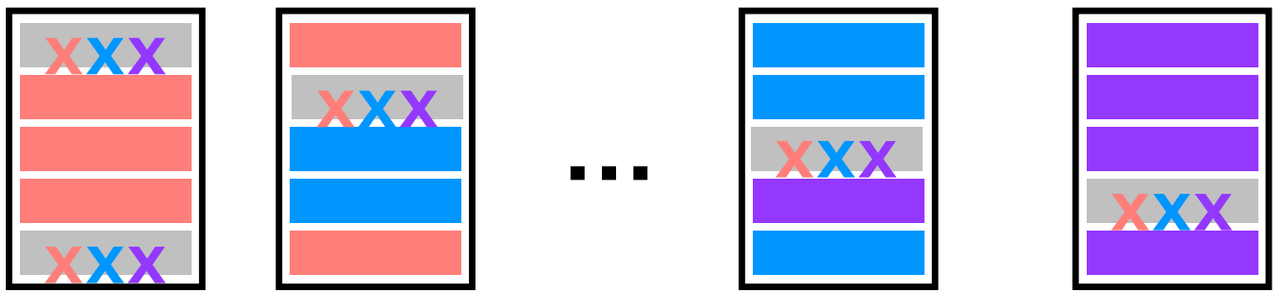

RAID 4 (dedicated parity disk)

sector i of the parity disk
is the xor of sector i
from all data disks

- 😀 can recover from single-disk failure
- 😀 requires N+1 disks (not 2N)
- 😀 performance benefits if you stripe a single file across multiple data disks
- 😭 all writes hit the parity disk

RAID 5 (spread out the parity)

😀 can recover from single-disk failure

😀 requires N+1 disks (not 2N)

😀 performance benefits if you stripe a single file across multiple data disks

😀 writes are spread across disks
